ZEBL · ATTENDANCE & HR PLATFORM

HR

User Guide

Workforce administration end to end — employees, attendance, payroll attendance, leave, recruitment, tickets, and the operational tools behind them.

Contents

01
Getting Started
Signing in to the admin workspace and how it's laid out.

02
The HR Command Center
Your dashboard — organization-wide, at a glance.

03
Employees
The directory and full employee profile.

04
Attendance & Regularization
The daily register and the correction-request queue.

05
Payroll Attendance
Period summaries, exports, and recompute.

06
Leave Management
Reviewing requests, the leave calendar, and leave policy vs. settings.

07
Helpdesk — Tickets
Managing employee support requests.

08
Uploading Attendance Data
Importing biometric data from Excel or PDF.

09 · If Enabled
Hiring Workspace
Recruitment, from job opening to converted employee.

10
System Operations
Analytics, operations health, notifications, integrations, audit log.

11
Security & Sessions
Org-wide login history and what HR can and can't do here.

12
Settings
HR, payroll, attendance, and leave configuration.

13 · If Applicable
My Own Workspace
If you're also an employee of the company yourself.

14
Where HR's Access Ends
What only a Super Admin can do, and why.

15
Getting Help & FAQ
Common questions, answered.

CHAPTER 01

Getting Started

Signing in to the admin workspace and how it's laid out.

This guide covers the HR role in ZEBL AMS — full workforce administration through the admin workspace, shared with the Super Admin role but without platform-level user/role management.

Signing in

Sign in with your work email and password, or Sign in with Microsoft if Entra ID is connected. You land on the HR Command Center at `/admin/dashboard`.

How the admin workspace is organized

The left-hand menu groups everything into: Core Workforce (Chapters 3–8), Hiring Workspace (Chapter 9, if recruitment is enabled for your organization), System Operations (Chapter 10), Security (Chapter 11), and Settings (Chapter 12). If you're personally linked to an employee record, you'll also see My Workspace (Chapter 13).

> **NOTE**
>
> You will not see a "Platform Administration" group — that's exclusive to Super Admin. See Chapter 14 for exactly where the line sits.

CHAPTER 02

The HR Command Center

Your dashboard — organization-wide, at a glance.

Your dashboard (`/admin/dashboard`) is the executive view of the whole organization: headcount, attendance and leave snapshots, and pending approvals, all in one place.

Use it as your daily starting point — it surfaces what needs attention today before you drill into a specific module.

CHAPTER 03

Employees

The directory and full employee profile.

Employees (`/admin/employees`) is the organization's people directory.

Browsing and searching

Search or filter the full employee list, then open any record to reach the individual profile.

Employee profile — `/admin/employees/[id]`

A full detail view: identity, an attendance summary that's date-range filterable, leave balances and history, and manager-assignment — pick who this person reports to, which is what drives their manager's "My Team" view.

> **TIP**
>
> Setting the manager assignment correctly here is the single most important step for the approval workflow and team-scoped views to work as expected.

CHAPTER 04

Attendance & Regularization

The daily register and the correction-request queue.

Two connected screens: the org-wide register, and the queue of correction requests waiting on your decision.

Attendance register — `/admin/attendance`

Search and filter every employee's daily attendance by date, payroll period, shift, shortfall, or overtime. Results are paginated, and days with an active regularization request are flagged.

Regularization queue — `/admin/attendance/regularization`

Every correction request an employee has submitted against their own punch record, organized into Pending, Approved, Rejected, and Cancelled tabs.

- Open a pending request to see the employee's stated reason next to the original raw punch record.
- Approve or reject. Approving applies a correction overlay — the original punch is preserved underneath, never overwritten.
- The employee is notified and can see the outcome on their own History page.

> **NOTE**
>
> Keeping the raw record intact is deliberate — it keeps every correction auditable later, including by Super Admin via the Audit Log (Chapter 10).

CHAPTER 05

Payroll Attendance

Period summaries, exports, and recompute.

`/admin/payroll-attendance` turns raw daily attendance into payroll-period summaries.

Filter by shortfall, overtime, late arrivals, absences, or "pending decision" to find exceptions before a payroll run. Export the result to CSV or PDF for payroll processing or an audit trail, and use Refresh to manually recompute a period after late corrections land.

> **BEFORE YOU EXPORT**
>
> Clear out any still-pending regularization requests for the period first (Chapter 4) — approved corrections change the numbers that flow into payroll.

CHAPTER 06

Leave Management

Reviewing requests, the leave calendar, and leave policy vs. settings.

Everything to do with organization-wide leave — requests, the calendar, and the policy document.

Leave requests — `/admin/leaves`

Review every leave request in the organization: filter by status or search for a specific employee, approve or reject, and check anyone's leave balance overview from the same screen.

Leave calendar — `/admin/calendar`

An organization-wide calendar of approved leave and holidays, filterable by department — useful for spotting coverage gaps before approving more time off.

Importing opening balances — `/admin/leaves/import`

Migrate legacy EL/CL/SL balances from an Excel file. Each run is tracked as a single batch so its changes can be audited together as a unit. It's a "set to" operation — it sets each employee's balance to the value in the file rather than adding to it, so re-running the same file is safe and idempotent.

> **TIP**
>
> The per-employee balance-adjustment form on an employee's profile (Chapter 3) also supports this "set to" mode alongside the existing add/deduct delta — use the bulk importer for a one-time migration, and the profile form for individual corrections afterward. The profile form only appears while "Allow HR to manually adjust leave balances" is on in Leave Settings.

> **UNPAID DAYS (LOP)**
>
> When an employee requests more days than their balance covers, the request is not rejected — it goes through the normal approval chain, and the days beyond the balance are recorded as Loss of Pay (LOP) on that same request. These show as "· N unpaid" in the request list, the approval record, and leave history, and flow into payroll. Requests over the monthly leave limit are different: they're blocked at submission.

Migration controls — manual balances and historical leave

Three switches under Settings ’ Leave Settings control how much HR can change directly on an employee's profile. They're meant for the migration period; turn them off once opening data is settled.

Setting	What it allows on the employee profile
`Allow HR to manually adjust leave balances`	The balance form on the Leave Balances tab — add/deduct, or "set to" a value. When off, the tab says manual adjustments are disabled and balances only change through accrual and approved requests.

`Allow HR to add historical leave entries`	An "Add historical leave" form on the Leave History tab for leave taken before go-live, with its real dates and reason. It's recorded as already approved and deducts the balance immediately — no approval chain.
`Allow HR to correct historical leave entries`	An edit option on existing historical entries. The original is reversed and kept on record, and a corrected entry is created in its place — nothing is silently overwritten.

Leave Policy vs. Leave Settings

`/admin/leave-policy` is the read-only, employee-facing document. The actual rules behind it — leave cycle, Earned Leave accrual, Sick Leave policy — are configured separately under Settings ’ Leave Settings (Chapter 12). Edit the settings; the policy page updates to match automatically.

CHAPTER 07

Helpdesk — Tickets

Managing employee support requests.

`/admin/tickets` is where every employee support request lands.

> **TIP**
>
> Filter the queue by category (Attendance, Leave, Payroll, IT/Technical, HR, Workplace, Facilities, Suggestion, Other), status, or priority to triage quickly. Tickets move New ’ Open ’ In Progress ’ Resolved ’ Closed, with Waiting for Employee and On Hold available when you're blocked on their reply.

- Open a ticket to see the employee's category, priority, subject, and description.
- Assign it to yourself or a colleague, and respond — replies can be public (visible to the employee) or internal notes (HR-only).
- Update status and priority as it progresses; every action is kept in a full audit trail on the ticket.

CHAPTER 08

Uploading Attendance Data

Importing biometric data from Excel or PDF.

`/admin/upload` imports biometric attendance from the device export.

> **TIP**
>
> Run imports before reviewing the regularization queue for the same period — that way you're approving corrections against complete data.

- Choose the file — Excel or PDF, in either the eSSL Daily or Summary format.
- For large files, the upload is chunked and resumable, so a dropped connection doesn't mean starting over.
- If preview-before-confirm is enabled, review the parsed rows before they're committed.
- Confirm the import — the new punches flow into Attendance (Chapter 4) and, from there, Payroll Attendance (Chapter 5).

CHAPTER 09 · IF ENABLED

Hiring Workspace

Recruitment, from job opening to converted employee.

Recruitment is the largest module in ZEBL AMS and may be switched off in your organization's deployment — if you don't see this menu group, ask your Super Admin whether it should be turned on.

The hiring flow moves in one direction

Stage	Screen	What happens
`1. Job Opening`	/admin/recruitment/jobs	Create the posting, hiring team, headcount, and pipeline stage template.
`2. Candidate`	/admin/recruitment/candidates	Full profile — experience, education, skills, documents. Upload a resume and use the review-before-accept import draft rather than trusting parsing blindly.
`3. Application`	/admin/recruitment/applications	Link a candidate to a job; track pipeline status and the assigned recruiter.
`4. Pipeline`	/admin/recruitment/pipeline	A drag-and-drop board through hiring stages; launch interviews, offers, or a conversion from each card.
`5. Interview`	/admin/recruitment/interviews	Schedule, assign panelists, and collect structured feedback (rating, recommendation, strengths/concerns).
`6. Offer`	/admin/recruitment/offers	Draft compensation ’ manager approval ’ HR approval ’ release ’ accept/decline. Produces a versioned offer-letter PDF.
`7. Conversion`	/admin/recruitment/conversions	The only path to "hired" — turns an accepted offer into a real Employee record, with a preview before you commit.

Supporting screens: Communications (candidate email inbox/drafts/templates), Reports (time-to-hire, sources, funnel, offer acceptance), and Settings/Analytics for the module itself.

> **NOTE**
>
> A small number of managers may be individually granted recruitment access without becoming HR — if you see a manager acting in this module, that's expected and intentional, not a permissions gap.

> **PUBLIC CAREER PORTAL**
>
> External candidates apply through `/apply` — a public page requiring no login. It only exists while recruitment is enabled.

CHAPTER 10

System Operations

Analytics, operations health, notifications, integrations, audit log.

Monitoring and configuration screens for the platform itself.

Screen	What it shows
`/admin/analytics`	Workforce intelligence — an offline-computed executive snapshot: anomalies and operational metrics.
`/admin/operations`	Background worker health, queue depth, failed jobs, and workflow integrity checks.
`/admin/notifications`	The email/Teams notification delivery queue — failures and retries.
`/admin/integrations`	Microsoft Teams webhook configuration, Outlook calendar sync status, Graph API health, escalation automation.
`/admin/audit`	The centralized audit trail: auth events, employee/role changes, leave workflow, tickets, approval tokens, calendar sync, Teams, org sync.

> **TIP**
>
> If an employee reports "I approved this by email but nothing changed," check Operations and the Audit Log first — most one-time-link issues show up there as an expired or already-used token.

CHAPTER 11

Security & Sessions

Org-wide login history and what HR can and can't do here.

`/admin/security` is the organization-wide login history and active session list — filterable by user, role, department, browser, date, or status.

Use it to investigate a reported account issue or confirm someone's last sign-in. (Legacy links: `/admin/security/active-sessions` and `/admin/security/login-history` both redirect here.)

> **TIP**
>
> Narrow a search fast by combining filters — e.g. a specific user plus a date range, or a role plus a department — rather than scrolling the full org-wide list.

CHAPTER 12

Settings

HR, payroll, attendance, and leave configuration.

Configuration for how the organization's rules are applied.

Screen	What you configure
`/admin/settings`	Workflow escalation, notification, and integration defaults; also your own change-password form.
`/admin/payroll-settings`	Payroll cycle start day, required office time, grace period, overtime thresholds, and per-shift overrides.
`/admin/shift-settings (view only)`	Named shifts — start/end time, grace period, expected work minutes — used across employee records and the attendance register. You can view this screen, but the form is read-only for HR; only Super Admin can save changes here.
`/admin/attendance-settings (view only)`	Default weekly working-day schedule and date-specific exceptions. You can view this screen, but the form is read-only for HR — only Super Admin can save changes here.
`/admin/leave-settings`	Leave cycle, Earned Leave accrual rules, Sick Leave policy, monthly and consecutive-day limits, advance notice, and the migration switches for manual balance adjustments and historical leave entries (Chapter 6) — this is what feeds the read-only Leave Policy page.

> **NOTE**
>
> If you need a change to the weekly working-day schedule, a date override, or a shift definition, raise it with your Super Admin — you'll see the current configuration but the save action is disabled for HR by design.

CHAPTER 13 · IF APPLICABLE

My Own Workspace

If you're also an employee of the company yourself.

If you, as an HR user, are also linked to an employee record — because you're an employee of the company yourself — a My Workspace group appears in your menu.

My Dashboard
Your own attendance snapshot.

My Attendance
Your own history.

My Leaves
Your own balances and requests.

My Profile
Your own details and photo.

NOTE

You will not get "My Team," ticket-raising, or an Approval Center here — those are Employee/Manager-shell features. Use them only if you're specifically acting as an approver elsewhere in the organization's chart.

CHAPTER 14

Where HR's Access Ends

What only a Super Admin can do, and why.

HR and Super Admin share nearly the entire admin workspace. These are the specific, deliberate exceptions — know them so you can escalate quickly instead of hunting for a missing button.

Area	HR	Super Admin
User accounts & roles	Can administer Employee and Manager accounts only (reset password, lock/unlock)	Full access, including HR and Super Admin accounts
Changing a user's role	Not available	Only place this can be done — at /admin/user-management
Attendance scheduling settings	View only	Can edit
Shift definitions	View only	Can edit
Anonymous tickets	No access	Full access, including submitter identity
Force-expiring a user's session	Not available	Available on /admin/security

TIP

None of this is a bug if a button is missing or a form is disabled — it's the platform's target-aware permission model working as intended. Raise a ticket or reach out directly to your Super Admin for anything in this table.

CHAPTER 15

Getting Help & FAQ

Common questions, answered.

An employee says their punch is missing entirely, not just wrong — what do I do?

Check whether the day's device export was imported (Chapter 8) before assuming it's a regularization case — a missing day usually means the import hasn't run yet for that date.

I changed someone's role-adjacent setting (like recruitment ops access) and nothing changed — why?

Permission and role changes require the affected user to sign in again — the change is carried in their session and won't apply until they refresh it by logging out and back in.

Why can't I edit the attendance settings or shift settings pages?

That's expected — both are Super Admin-only to edit, HR-viewable only. See Chapter 14.

An employee wants to submit a ticket anonymously — can I see who it is?

No. Anonymous ticket identity is visible to Super Admin only, by design.

I suspect an account is compromised — what do I do?

Escalate to your Super Admin immediately — you can see the account's sessions at `/admin/security`, but only Super Admin can force-expire them (Chapter 14).

Where do I go for anything not covered in this guide?

Check the Audit Log (Chapter 10) for a factual trail of what happened, or escalate to your Super Admin for anything listed in Chapter 14.

ZEBL AMS

End of the HR User Guide.
